WHICH SIDE OF THE "GULF" ARE YOU ON?
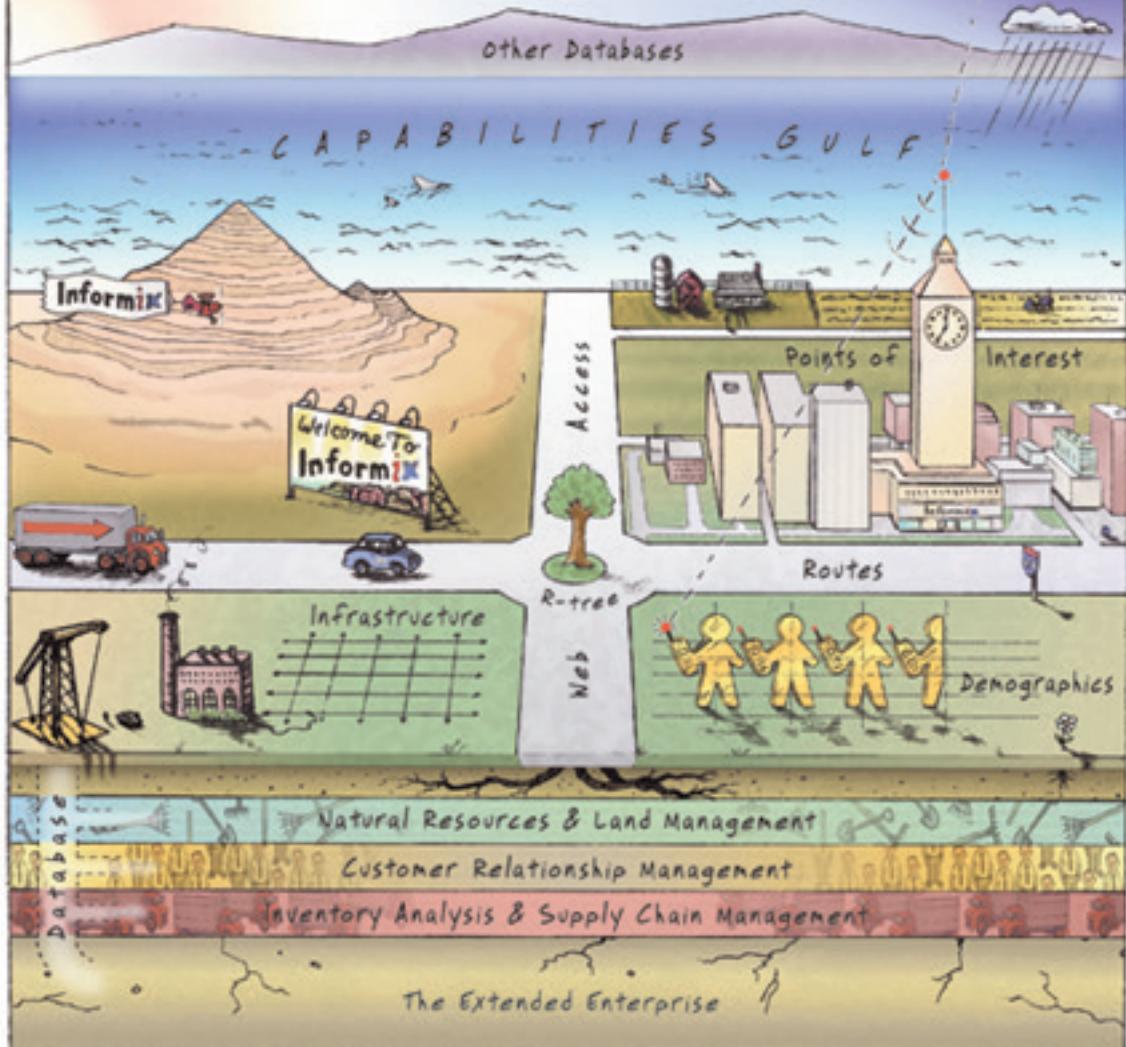

When it comes to administering utilities or routing your fleet, analyzing customer behavior or managing natural resources, even providing wireless point of interest information… expedient access to spatial data, and the means to analyze it, is critical.

GET _REAL_ SPATIAL. At Informix, we believe spatial data should take its place alongside all the other types of information typically found in conventional databases. In fact, we're the only company to spatially enable our "core line" of database servers—Informix® Dynamic Server™ and Internet Foundation.2000™—with **_full_** support for spatial types and functions, built-in—**_at no additional cost._**

WITH INFORMIX, complex spatial data can be accessed via standard SQL statements. And, best of all, our exclusive R-tree indexing gives you the **_fastest access_** and the **_most robust_** analytical capability in the industry.

For more information and a tour of our spatial technology, visit www.informix.com/spatial
